

Apply filters to SQL queries

Project description

In this project, I used SQL queries to investigate potential security issues by filtering and retrieving data from the `log_in_attempts` and `employees` tables. This involved identifying failed login attempts, examining suspicious login dates, and gathering information on specific employees and departments.

Retrieve after hours failed login attempts

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE login_time > '18:00' AND success = 0;
```

event_id	username	login_date	login_time	country	ip_address	success
2	apatel	2022-05-10	20:27:27	CAN	192.168.205.12	0
18	pwashing	2022-05-11	19:28:50	US	192.168.66.142	0
20	tshah	2022-05-12	18:56:36	MEXICO	192.168.109.50	0

This query selects all records from the `log_in_attempts` table where the `login_time` is after 18:00 and the `success` column is 0, indicating failed login attempts after business hours.

Retrieve login attempts on specific dates

```
MariaDB [organization]> SELECT * FROM log_in_attempts  
-> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
```

event_id	username	login_date	login_time	country	ip_address	success
1	jrafael	2022-05-09	04:56:27	CAN	192.168.243.140	1
3	dkot	2022-05-09	06:47:41	USA	192.168.151.162	1
4	dkot	2022-05-08	02:00:39	USA	192.168.178.71	0

This query retrieves all login attempts from the `log_in_attempts` table that occurred on May 8th or May 9th, 2022, to investigate suspicious activity on these dates.

Retrieve login attempts outside of Mexico

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE NOT country LIKE 'MEX%';
```

event_id	username	login_date	login_time	country	ip_address	success
1	jrafael	2022-05-09	04:56:27	CAN	192.168.243.140	1
2	apatel	2022-05-10	20:27:27	CAN	192.168.205.12	0
3	dkot	2022-05-09	06:47:41	USA	192.168.151.162	1

This query selects all login attempts from the `log_in_attempts` table where the `country` column does not start with "MEX," identifying login attempts originating outside of Mexico.

Retrieve employees in Marketing

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Marketing' AND office LIKE 'East%';
```

employee_id	device_id	username	department	office
1000	a320b137c219	elarson	Marketing	East-170
1052	a192b174c940	jdarosa	Marketing	East-195
1075	x573y883z772	fbautist	Marketing	East-267

This query retrieves all employees from the `employees` table who work in the Marketing department and have offices located in the East building, as identified by the `office` column starting with "East."

Retrieve employees in Finance or Sales

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Finance' OR department = 'Sales';
```

employee_id	device_id	username	department	office
1003	d394e816f943	sgilmore	Finance	South-153
1007	h174i497j413	wjaffrey	Finance	North-406
1008	i858j583k571	abernard	Finance	South-170

This query selects all employees from the `employees` table who belong to either the Finance or Sales departments, as indicated by the `department` column.

Retrieve all employees not in IT

```
MariaDB [organization]> SELECT * FROM employees WHERE NOT department = 'Information Technology';
```

employee_id	device_id	username	department	office
1000	a320b137c219	elarson	Marketing	East-170
1001	b239c825d303	bmoreno	Marketing	Central-276
1002	c116d593e558	tshah	Human Resources	North-434

This query retrieves all employees from the `employees` table who are not in the Information Technology department, ensuring they receive necessary updates.

Summary

This project involved using SQL queries to investigate security issues by filtering and retrieving data from the organization's `log_in_attempts` and `employees` tables. By applying specific filters, I was able to identify after-hours failed login attempts, investigate suspicious login dates, determine the origin of login attempts, and gather information on employees from various departments. This process is crucial for maintaining the security and integrity of the organization's systems.
